Exercise 3: Event Storming

Software Architecture

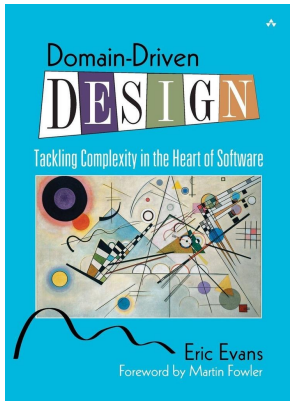

Winter Semester 2026/27

Tobias Arens M.sc.

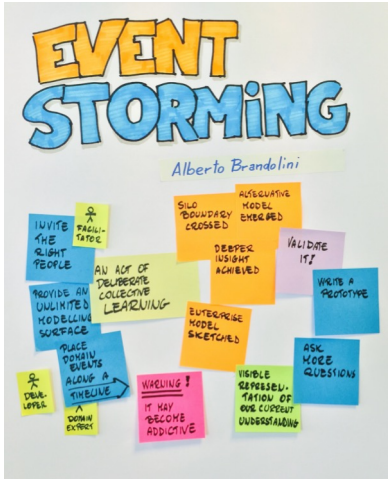

Software Architecture Teaching and Research Unit
RWTH AACHEN UNIVERSITY

Event Storming

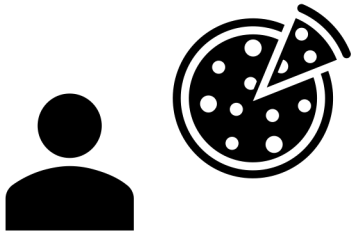

“The critical complexity of most software projects is in understanding the domain itself.”

Event Storming is a workshop format for quickly exploring complex business domains.

Event Storming: Example Domain

Customers making pizza orders

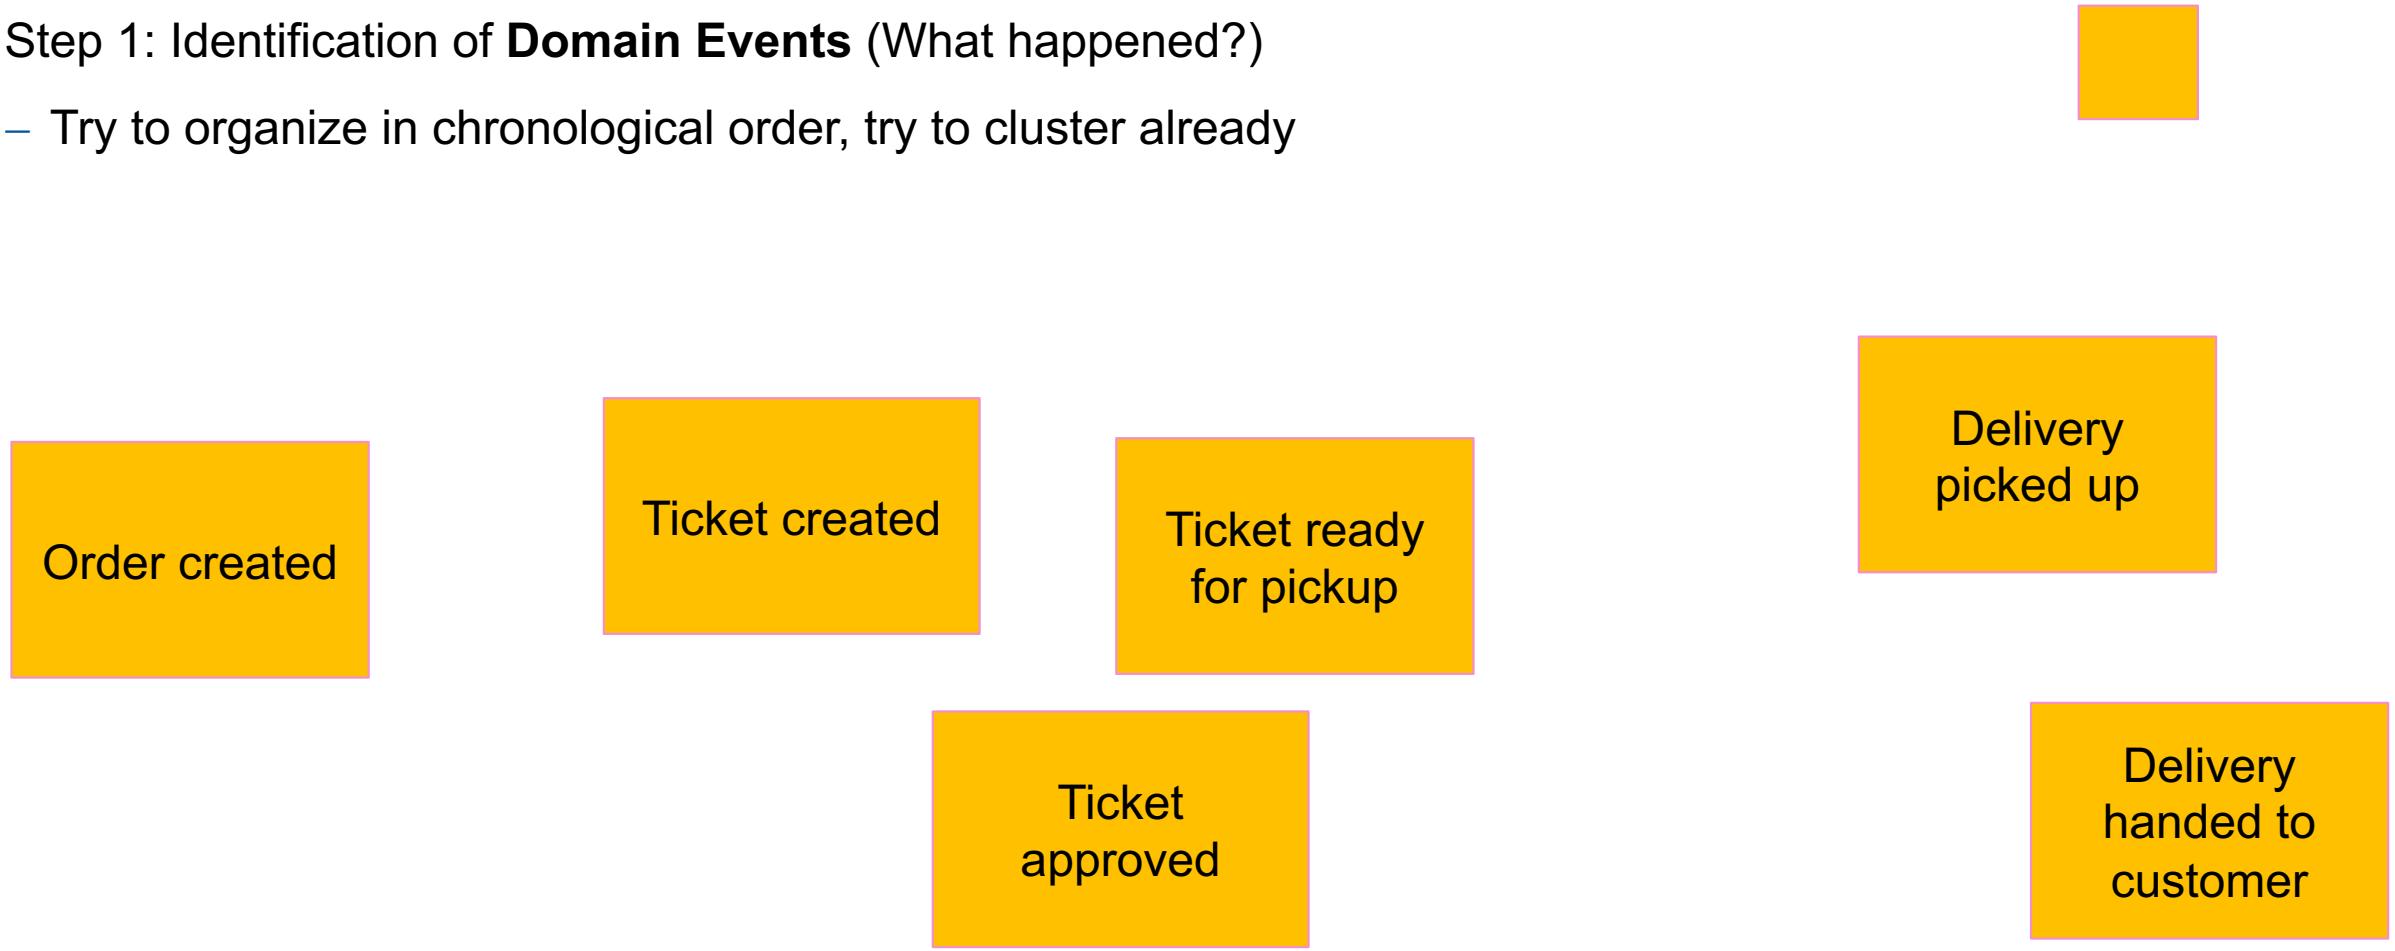

Food delivery service delivering the ordered pizzas

Kitchen preparing pizza orders

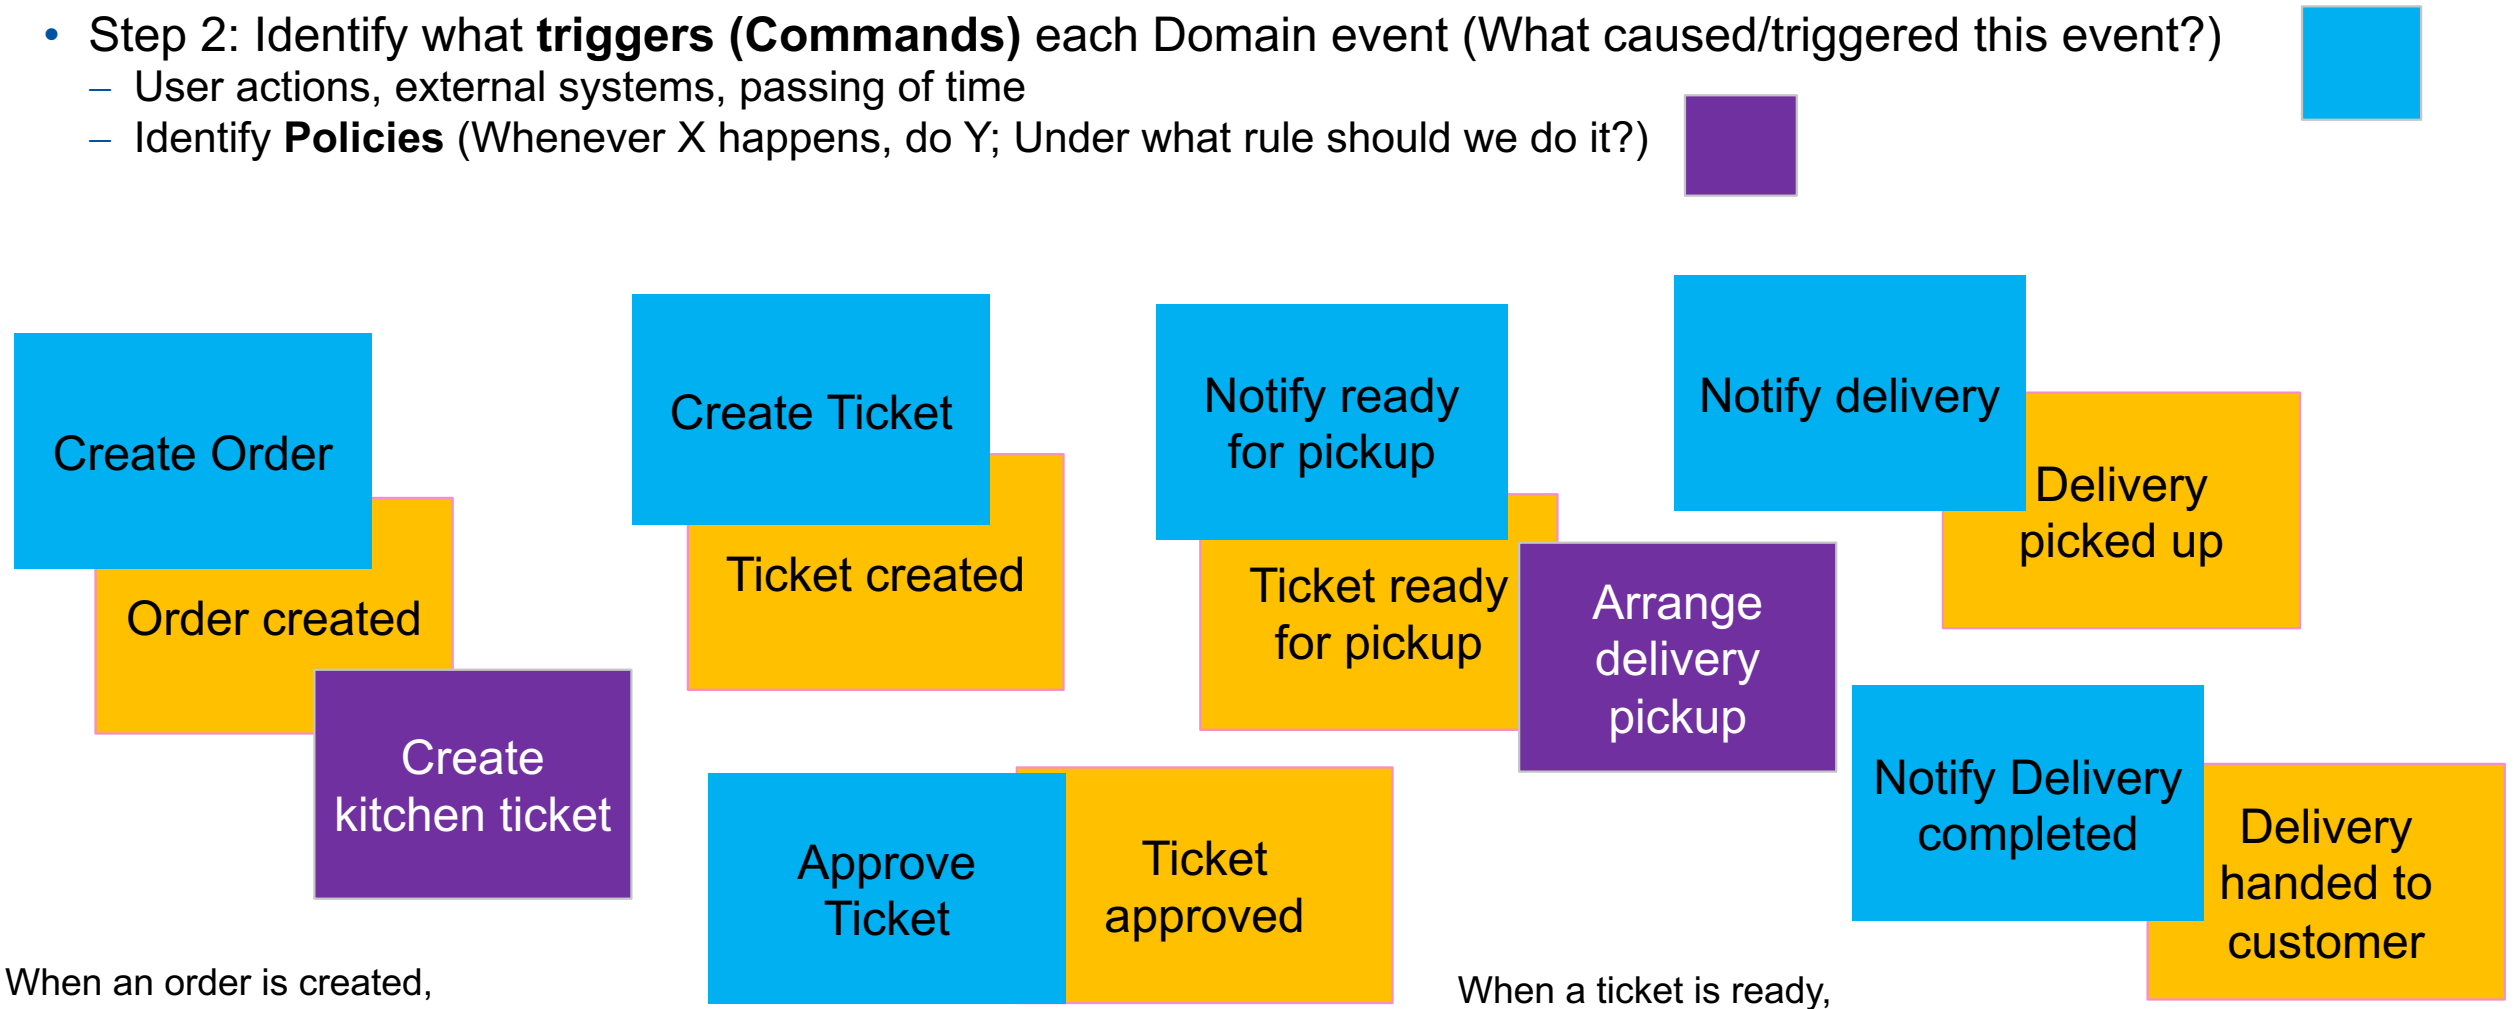

Event Storming

- Step 1: Identification of **Domain Events** (What happened?)
  - Try to organize in chronological order, try to cluster already

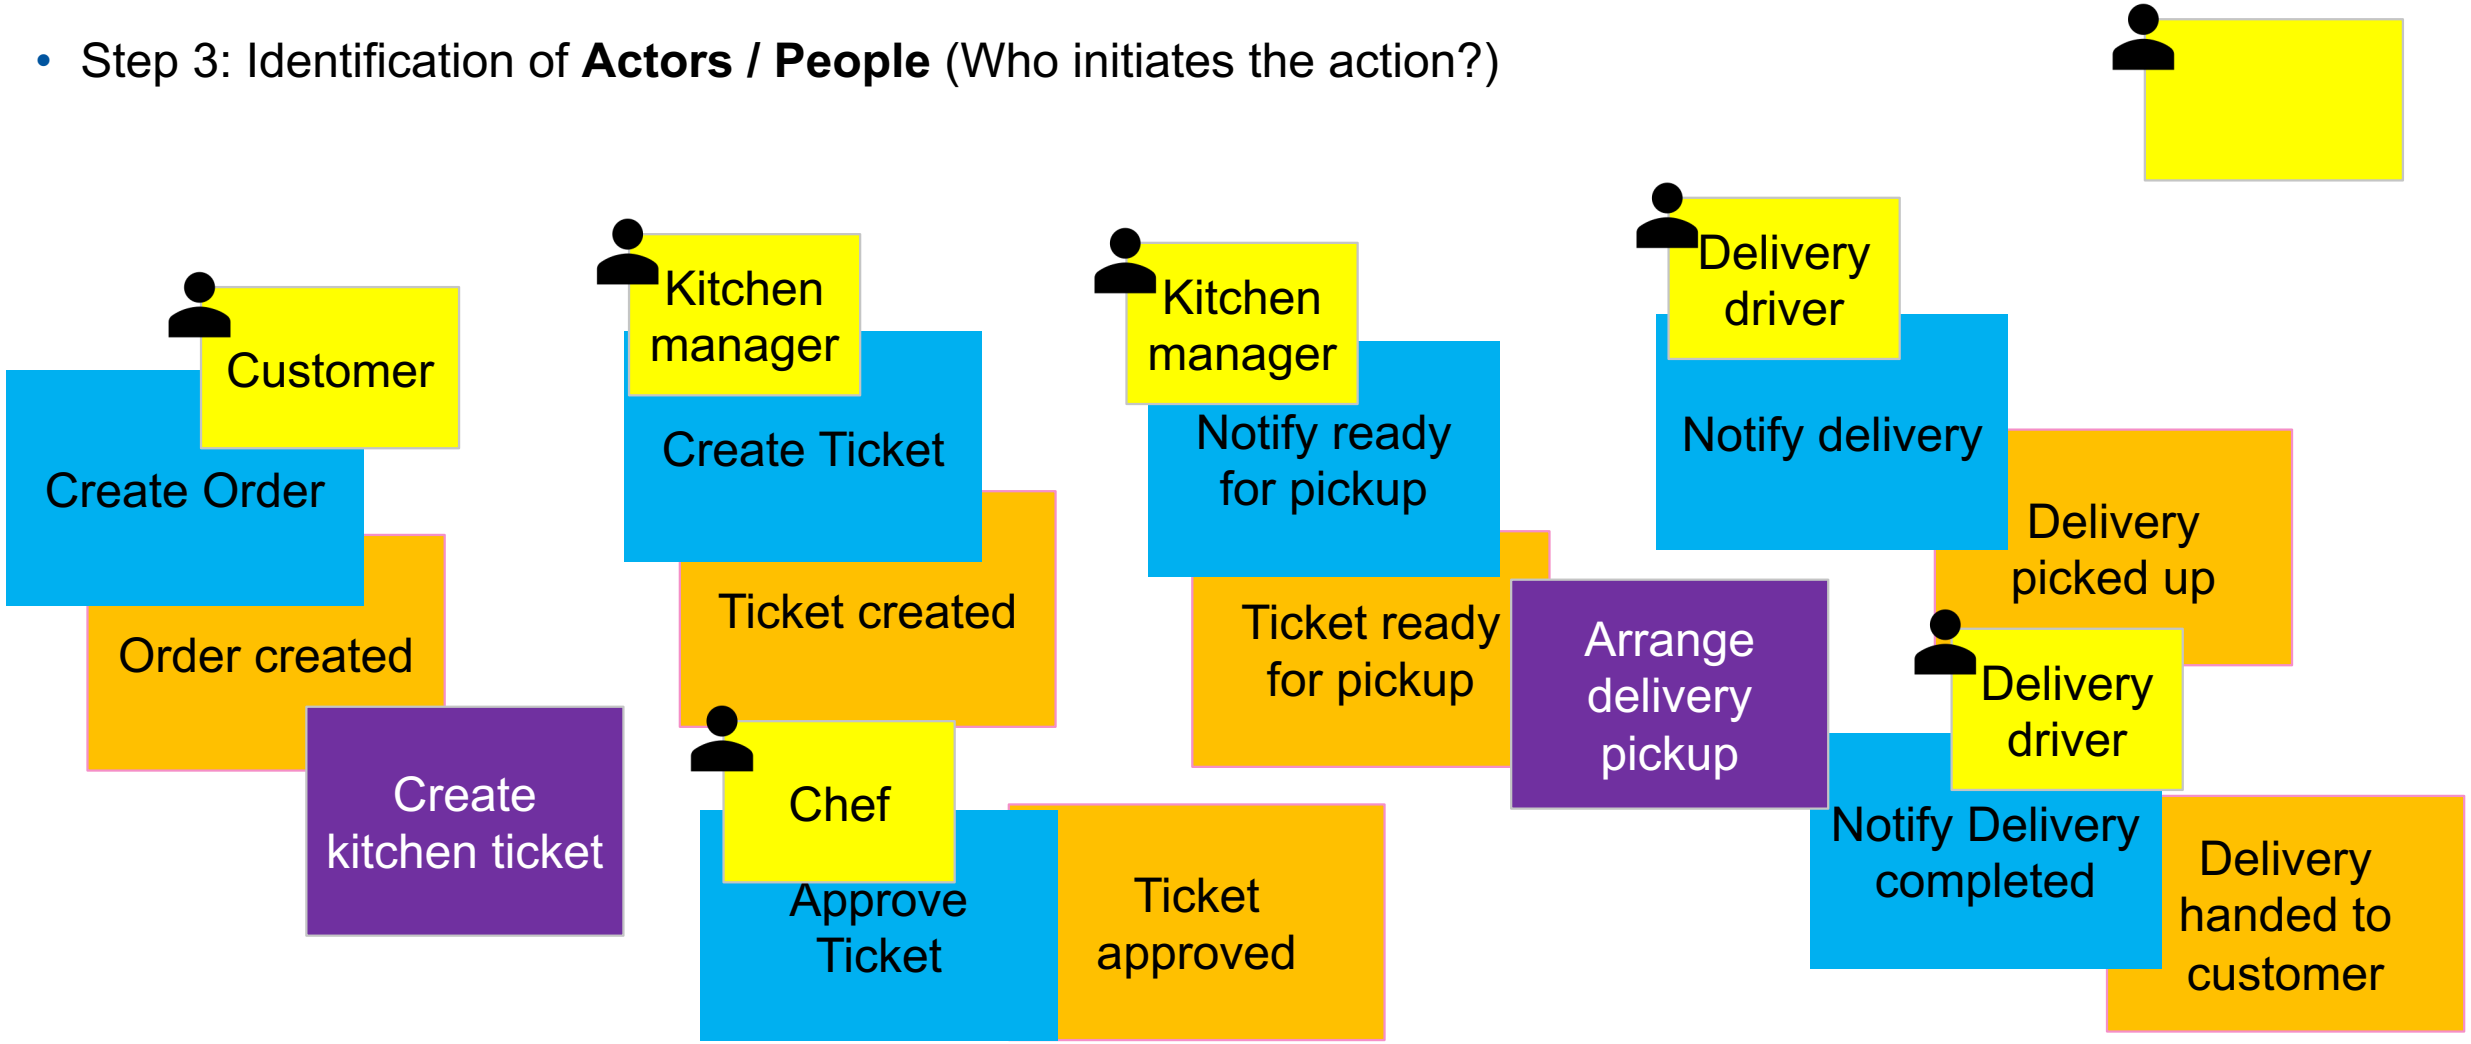

Event Storming

- Step 2: Identify what **triggers (Commands)** each Domain event (What caused/triggered this event?)
  - User actions, external systems, passing of time
  - Identify **Policies** (Whenever X happens, do Y; Under what rule should we do it?)

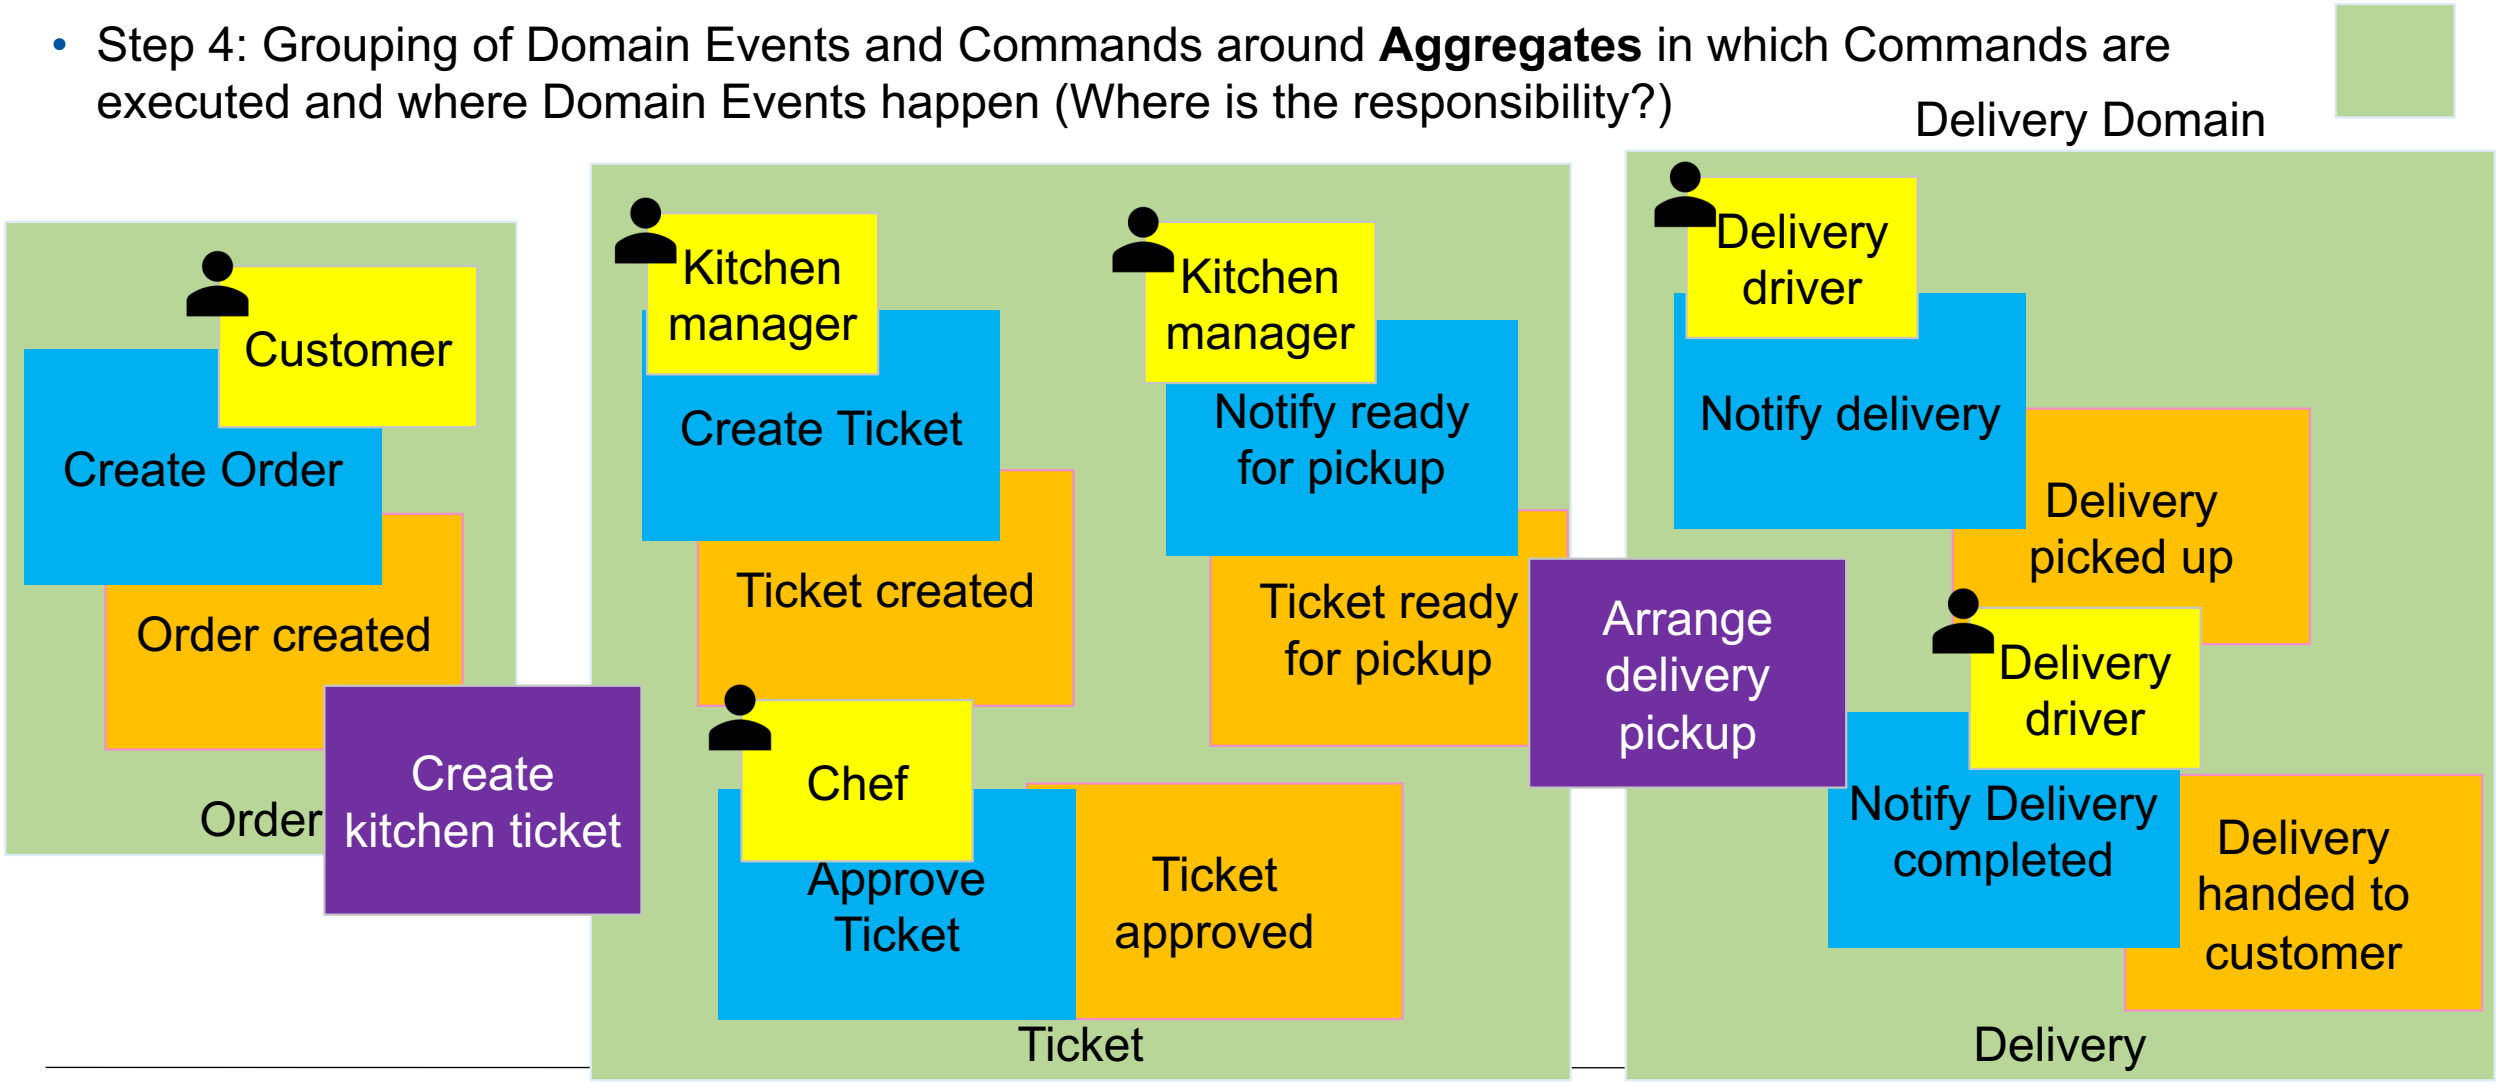

Event Storming

- Step 3: Identification of **Actors / People** (Who initiates the action?)

Event Storming

- Step 4: Grouping of Domain Events and Commands around **Aggregates** in which Commands are executed and where Domain Events happen (Where is the responsibility?)

Event Storming: Another (Complete) Example
